

COMMERCIAL PROPOSAL · CONFIDENTIAL DRAFT

Open Finance operations, *out of the box.*

A distribution partnership between MiddleLeap and Ozone

Ozone connects the market to Open Finance. This partnership lets the market run it.

MiddleLeap builds · Ozone distributes · SIs deliver

A mandate the whole market must meet — *and cannot build for.*

~50

BANKS MANDATED

60+

INSURERS & BROKERS

AED 200–5M

PER-EVENT LIABILITY

The release calendar is fixed:

- ◆ Extended Data + Insurance Quotes — R4+, Apr 2026
- ◆ Corporate suite — R5, Sep 2026
- ◆ Insurance data-sharing onboarding — 2026-Q3
- ◆ CAAP migration — 2026-Q4

Certified ≠ operationally live.

API Hub = control plane. LFI = *execution layer*.

OZONE OWNS — CONNECTIVITY

- ◆ API Hub — authorises consent, issues tokens
- ◆ Mediates every TPP ↔ LFI call
- ◆ Ozone Connect — certifies the LFI onto the network
- ◆ CAAP centralized authentication

NOT YET SUPPLIED — OPERATIONS

- ◆ Fee & settlement reconciliation (3-way)
- ◆ Consent & dispute operations, refunds
- ◆ Mandatory reporting — incl. 16 login-only reports
- ◆ Liability exposure monitoring
- ◆ Four-eyes governance, audit, BCBS 239 lineage
- ◆ TPP-of-record billing

None of this is connectivity. All of it is mandatory. This is the layer the tail cannot build.

The operations layer, *already built.*

◆ Reconciliation

3-way match vs the hub, break workflow, dispute filing, margin

◆ Customer care

Consent search, <5s revoke, four-eyes refunds, inquiry bundles

◆ Analytics

Executive, compliance, risk & finance views; liability monitor

◆ Regulated substrate

RBAC, four-eyes, INSERT-only audit, BCBS 239 lineage, MFA

◆ Integration enablers

Nine ports to the institution's estate (P1–P9)

◆ Scheme & TPP billing

TPP registry, reconcile-before-invoice, scheme cases

*Built for the institution that wears two hats: **LFI** for inbound traffic and **TPP-of-record** for the fintechs it hosts.*

Built to be distributed — *not rebuilt each time.*

◆ Vendor-neutral by construction

Every institution-specific system is a port (P1–P9). The core never references a vendor; the estate is mapped in configuration.

◆ Adapter swap, not rewrite

Each port has a simulator and an enterprise adapter behind one interface. Porting = adapter replacement + a Bank Profile, gated by the same contract tests.

◆ Multi-tenant from day one

Every regulated table carries a tenant key under forced row-level security; serverless, region-parameterised. Scaling is hardening, not re-design.

◆ Real today

A live seeded demo runs the whole story — one fraud incident across five consoles — with a fault-injection switch, on synthetic data only.

This *completes* Ozone's offer.

Already powers the hub

OFBO consumes hub surfaces via the single P6 egress and Ozone Connect. It never re-implements the gateway — strictly complementary.

Already runs the channel

Ozone's partner program spans Referrer → Reseller → Premium Reseller → dedicated partner-branded infrastructure, with white-label & co-marketing.

Already has the SIs

The channel that integrates Ozone's platform is the same channel that maps OFBO's ports. No new delivery network needed.

Wins the buyer who won't build

'Connect me' is half the ask; 'let me run it' is the other half. A combined offer is harder to match and easier to say yes to.

From connectivity → connectivity + operations.

MiddleLeap builds · Ozone distributes · *SIs deliver.*

MIDDLELEAP

OEM product vendor

Build · roadmap · maintenance · L3 · platform ops

OZONE

OEM reseller / distributor

Relationship · brand · billing · first-line · enablement

SIS

Delivery

Port mapping · adapter integration · Bank Profile · go-live

Lead model: full reseller / OEM white-label (Ozone's or the Al Tareq brand). Two tiers on one codebase:

Console tier — resell / white-label freely

Consent ops · care · dispute cases · mandatory reporting · audit posture. The volume tier for the long tail.

Assurance tier — independently operated, Ozone-distributed

Reconciliation · fee verification · liability · SLA. The independence safeguard keeps it credible to an examiner.

How the money works (*mechanics, not figures*).

01

Recurring per-tenant subscription

OEM licence MiddleLeap → Ozone; Ozone sets end price, keeps margin. The annuity that scales with the mandate.

02

One-time onboarding / integration

SI-led delivery revenue per institution, with a defined MiddleLeap enablement + L3 role.

03

Optional premium modules

Assurance tier, insurer module, advanced analytics — add-ons on the console base.

Money flow: Institution → Ozone → MiddleLeap (OEM fee); SIs earn integration (+ optional recurring share).

Value anchors: liability exposure avoided (per institution) · the cost & risk of building in-house avoided.

Figures are for negotiation. Structure follows Ozone's partner ladder, tiered per-institution 'as-a-service' norms, and the ISV-builds / channel-distributes / SI-integrates split.

A funnel that *already exists*.

Sequence mirrors the CAAP extension calendar. Lighthouse: 2–3 insurers or exchange houses on the 2026 onboarding calendar.

Demonstrable today — *honest about what's next.*

WHAT IS PROVEN

- ◆ Live OFBO demo — six consoles, fault injection
- ◆ Open Data Sandbox — ~38 personas, 3 domains, v2.1-accurate
- ◆ Governed discovery → delivery build method
- ◆ UAE firsts: first bank certification; first live licensed-TPP txns

STATED PLAINLY

- ◆ Demo-proven, not production-proven
- ◆ Synthetic data only — no real PSU data, ever
- ◆ Multi-tenant control plane: designed & backlogged, not built
- ◆ Production hardening is joint partnership work

Our brand runs on numbers we can count. We will not represent readiness we have not earned.

◆ ROADMAP & THE ASK

The joint path *to production.*

PRODUCTION HARDENING (SEQUENCED, HUMAN-GATED)

1

Isolation hardening

2

Tenant provisioning

3

Per-tenant cert custody

4

Operator certs (SOC 2 / ISO 27001*)

5

Insurer module + ROI

**Ozone already holds ISO/IEC 27001.*

WHAT WE ASK OF OZONE TO START

◆ Channel commitment

Carry OFBO as a value-adding layer in the partner program.

◆ A lighthouse customer

One or two institutions from the 2026 onboarding calendar.

◆ SI enablement

A first delivery partner briefed on the port-mapping playbook.

◆ Scheme positioning

A joint Nebras / CBUAE conversation on outsourcing & independence.

Let's put a working session *in the calendar*.

- 1 **A 45-minute working demo** Consent revoke → dispute → report → refund → scheme case, fault injected live.
- 2 **A commercial working session** Packaging, tiers and OEM / rev-share against your partner-program spine.
- 3 **A scoped lighthouse pilot** 2–3 institutions on the 2026 calendar, one SI briefed.
- 4 **A joint scheme conversation** Nebras / CBUAE on the outsourcing and independence posture.
